

Abstract

A device for sampling body fluid, the device comprising, a main
body, a lancet disposed within the main body, a carrier disposed within the
5 main body fixedly attached to the lancet, a biasing means in
communication with the lancet and the carrier, an annular space disposed
within the main body adjacent the lancet, and a means for measuring a
body fluid. Wherein the means for measuring the body fluid may include
micro-porous test strips, an electronic testing device, an optical/reflectance
10 testing measuring device, or a visual inspection.
